

This is clearly unlike either *Sekine et al.* or *Miyakawa et al.*, neither of which discloses or suggests a single image-capturing means that has a plurality of image-capturing regions, wherein each set of lenses and reflections means corresponds to a different one of the image-capturing regions. Unlike Applicant's claims 1, 2, and 7, *Sekine et al.* discloses two CCD devices each with one image capturing region, and *Miyakawa et al.* discloses a one camera with only one image capturing region. *Ishihara* and *Tabata et al.* also fail to disclose or suggest a single image-capturing means that has a plurality of image-capturing regions, wherein each set of lenses and reflections means corresponds to a different one of the image-capturing regions. Accordingly, none of the cited references, taken singly or in combination, could disclose or suggest Applicant's claims 1, 2, and 7.

Claims 3-6 depend directly or indirectly from claims 1, 2, or 7 and are therefore allowable for at least the same reasons that claims 1, 2, and 7 are allowable.

Applicant respectfully submits that the rejections of the Final Office Action of May 13, 2002 have been overcome and requests that they be withdrawn.

#### CONCLUSION

In view of the foregoing, it is submitted that claims 1-7 are patentable. It is therefore submitted that the application is in condition for allowance. Notice to that effect is respectfully requested.

Respectfully submitted,

 (Reg. No. 45,034)

**VERSION WITH MARKINGS TO SHOW CHANGES MADE**

**In the Claims:**

Please amend claims 1, 2, and 7 as follows:

1. (Twice Amended) A three-dimensional image-capturing apparatus comprising:  
a single image-capturing device having a plurality of image capturing regions; and  
a plurality of optical systems for forming images of a subject in the image-capturing regions, each one of the optical systems corresponding to a different one of the image-capturing regions, the optical systems including a plurality of reflection means for reflecting rays from said subject a number of times, and at least a lens provided to be closer to said single image-capturing device than the closest reflection means to said subject among the reflection means;

wherein the reflection means and the [lens] lenses of the optical systems are used to form, in the corresponding image-capturing regions, separate images of said subject which are captured from different viewpoints having a distance therebetween.

2. (Three Times Amended) A three-dimensional image-capturing apparatus comprising:  
a single image-capturing device;

a plurality of imaging-side reflection means having reflectors provided to be obliquely outward, each one of the imaging-side reflection means corresponding to one of [for] a plurality of different portions of an image-capturing region of said single image-capturing device;

a plurality of subject-side reflection means having reflectors provided[, for the imaging-side reflection means,] outer from the imaging side reflection means so as to be oblique with respect to a subject, each one of the subject-side reflection means corresponding to a different one of the imaging-side reflection means, the subject-side reflection means reflecting rays from said subject to the corresponding imaging-side reflection means;

a plurality of lenses or lens units provided to be closer to said single image-capturing device than the subject-side reflection means in optical paths formed from said subject to the different portions of the image-capturing region so that rays from said subject to the different portions of the image-capturing region are reflected by the imaging-side reflection means through the lenses or lens units, each one of the lens or lens unit corresponding to a different one of the different portions of the image-capturing region, the lenses or lens units forming a plurality of images of said subject which have parallax; and

a plurality of diaphragms, each one of the diaphragms corresponding to a different one of the lenses or lens units, in which when each optical path has a lens, the diaphragms are provided to be closer to said subject than the corresponding lens and in which when each optical path has a lens unit, the diaphragms are provided to be closer to said subject than a lens of the corresponding lens unit.

7. (Twice Amended) A stereo-camera recording/reproducing systems comprising:

- a three-dimensional image-capturing apparatus comprising a single image-capturing device having a plurality of image-capturing regions and a plurality of optical systems, each one of the optical systems for forming [images] an image of a subject in [the] a different corresponding one of the image-capturing regions;
- a timing generator for driving said three-dimensional image-capturing apparatus so as to output the images formed in the image-capturing regions in the form of a single video signal;
- a driver;
- a camera signal processor for implementing camera signal processing on the single video signal;
- a signal recorder for recording, on a single recording medium, the processed video signal output from said camera signal process;
- a single reproducer for reproducing the video signal recorded on the recording medium;
- a video separating circuit for separating the reproduced video signal from the reproducer into signals corresponding to the image-capturing regions; and
- display apparatus for displaying the signals corresponding to the image-capturing regions, which are output from said video separating circuit;

wherein the optical systems include a plurality of reflection means for reflecting rays from said subject a number of times and at least a lens provided to be closer to said image capturing device than the reflection means closest to said subject, each one of the reflection means corresponding to a different one of the image-capturing regions, and

wherein the reflection means and the [lens] lenses are used to form, in the corresponding image-capturing regions, separate images of said subject which are captured from different viewpoints having a distance therebetween.

CERTIFICATE OF MAILING

I hereby certify that this correspondence is being deposited as First Class Mail in an envelope addressed to Asst. Commissioner for Patents, Washington, D.C. 20231 on October 14, 2002.
